I have the following set up: In a function I have an object pd: `function test(x, y){ pd = { x: y, y: x }; return pd; }` If I call test and pass it x and y parameters, I get the correct values. But if I want to use pd inside methods (inside same function) it doesn't work. `test(3, 2);` or `function test(x, y){ this.pd = { x: y, y: x }; return this.pd; }` `function test2(){ this.x = 5; this.y = 6; test(3, 2); }` how can I make this work? A: In your second example, you are actually creating a new instance of the object, which means you won't be able to access the object via this. To fix this, you would change your example to: `function test(x, y){ this.pd = { x: y, y: x }; return this.pd; }` `function test2(){ test.call(this, 3, 2); }` An alternative approach would be to keep your first example and then reference the object via this. `function test(x, y){ this.pd = { x: y, y: x }; return this.pd; }` `function test2(){ this.x = 5; this.y = 6; test(3, 2); }` Q: Bootstrap grid, fluid

I'm trying to replace letters in a string with letters in a different string. `names = [a,b,c]` for i in names: #do something This does not work. But this does: for i in range(len(names)): #do something A: It is because you are in a python interpreter, which does not have the concept of "intermediate variables". For your first example: `names = [a,b,c]` for i in names: #do something names is never used afterwards, only the variable i will

be used For your second example: `names = [a,b,c]` for `i in range(len(names))`: #do something This will work, because `i` is an actual variable, but only inside the loop. As soon as it leaves the loop, it becomes useless. A: You can try `1d647c40b`
