FileExtensionManager is designed to automatically and permanently change files extensions on your PC. It's free and completely safe to use, but it's a trial version, so you can use this product and decide if it is right for you. During the first stage, the product detects file extensions and icons on your PC and changes them according to your preferences. It also allows you to set icons for unknown file extensions and "open with" files. The main features of the application allow you to change the type of: file extensions, define new file extensions and icons for them. The system allows you to create a list of executable files and add them to the "open with" option. This application also allows you to change the system settings for icons associated with known file extensions. When the trial version is used, you will be informed that the program is not fully functional and it will ask you to purchase the program. What's New In?

FileExtensionManager's interface isn't exactly anything special. It merely allows you to add, remove and alter registry entries related to file extensions. This program also displays information regarding the entries specified by the user, so there is no confusion about what will be done with the modified entry. The app comes with a simple interface where you are able to alter entries that are either already there or do not exist in the system yet. If needed, this program allows you to adjust registry entries by simply clicking the desired item in the registry editor. Buttons are always available at the bottom of the interface, allowing one to make use of the app. Once the program detects that you have an entry you want to alter, you're able to add or remove the file extension with it. Similarly, you can change the entries' extension association by clicking the checkbox beside the desired extension. You're able to hide extensions by including a plus sign in front of the string used to define the entries. Similarly, the extension can be hidden by clicking the small checkbox present next to it. This change has the potential to break the program if you're not careful. If you wish to apply the changes you've made to the registry entries, do so by simply clicking the 'Apply' button. It should take you back to the main interface of the program. After altering the entries specified by you or simply by the program, you'll be able to apply the changes you've made. This too is only possible using the 'Apply' button. Following the completion of the job, the app will display a useful error message in case of an error or problem. FileExtensionsManager is an app with a rather limited number of uses, so any errors you might experience are expected. Perhaps the biggest issue with the app's functionality lies in its compatibility. It doesn't support all registry branches, file type or parameter types. In addition, many are in no position to use the app without knowledge of how the registry works. If you'd like to customize the behavior of file extensions in Windows, try the Registry File Editor. If you'd like a program that allows you to automatically detect file extension registry entries as you edit them, you should consider RegEdit. If you would like to modify file extensions with the help of the Windows operating system, you should consider Extended File and Folder Options. If you are an expert at working with the registry, you should look into those apps that allow you to make alterations to it.
