1. Field of the Invention The present invention relates to a method of designing and producing a semiconductor device. 2. Description of the Related Art A typical conventional process of designing and producing a semiconductor device will be described below. First, logic simulation is performed to confirm the logic of a semiconductor device. In addition, simulation is performed to confirm a delay time and power consumption of the semiconductor device. Next, a pattern drawing program is executed to design a mask pattern for the semiconductor device. At the same time, verification data are produced by logic simulation based on the mask pattern, and the verification data are checked for any abnormality. If an abnormality is found, the mask pattern is modified. Thus, the mask pattern is iteratively modified. A typical mask pattern of a semiconductor device will be described below. For example, a general mask pattern of a semiconductor device is illustrated in FIG. 15. An example of a mask pattern of a gate electrode of the semiconductor device is illustrated in FIG. 15. First, the circuit configuration of the semiconductor device is described with reference to FIG. 16. The semiconductor device has two inverters INV0 and INV1, and a p-channel MOS transistor MT0 and an n-channel MOS transistor MT1. The gates of the p-channel MOS transistor MT0 and the n-channel MOS transistor MT1 are connected to the input side of the inverter INV0. The gates of the p-channel MOS transistor MT0 and the n-channel MOS transistor MT1 are connected to the input side of the inverter INV1. The outputs of the inverters INV0 and INV1 are connected to the input side of a NOR circuit NOR0. The output of the NOR circuit NOR0 is connected to a gate of the p-channel MOS transistor MT0 and a gate of the n-channel MOS transistor MT1. A p-channel MOS transistor MP0 is connected between the power supply Vdd and the output of the NOR circuit NOR0. An n-channel MOS transistor MN0 is connected between the ground potential Vss and the output of the NOR

**This switch mode DC-DC converter (or bypass driver) is a simple circuit that allows low input voltage (like a battery or solar panel) and low output voltage (like a 5V microcontroller) to be plugged into the same circuit through a single voltage regulator. This LED light is a small circuit that turns on all 5 LEDs when the power button is pressed and off again when the button is released (this is what has inspired this article). You can use it in applications where batteries need to act like a variable voltage supply to one device and [...] These LED drivers are very basic and require an external switch or relay to switch the high side driver on or off (they are basically 5N14 or IRF520 transistors so don't overload them if you use them for something more than just driving LEDs). If you use these drivers in a non-integrated [...] This little LED driver board is a very simple but extremely useful circuit for switching the LEDs on and off. Their design is such that it will work for all the 5 pin types, i.e., 7mm,12mm,15mm and 20mm. The simple circuit is able to switch three LEDs on and off (fully) or one [...] This easy to solder cable assembly is made to connect a light bulb to a solid state relay and in the future replace the switching entire lighting system by just connecting one part. It is made from two parts: the outer shell containing the spring clip and the spring, and the interior core housing the [...] Free Charge Controller is a small yet very useful circuit that allows you to use your smartphone as a charger for your portable devices (phones, tablets, etc.). Instead of using the traditional charging methods such as USB charger or wall charger, this kit will allow you to charge your device with no cables [...] This powerful and high RPM motor controller allows you to use 3.7V SRD18 motors as the power supply for your projects without having to limit the range of motion or needing an additional power source**
