The problem with these simple transfers (and they are very simple) is that some, like wired, are more reliable than wireless. Wireless is slower than wired, and it's even slower over longer distances. Plus, your dog may come across your wireless headset and take it off. 1 Dec 2016 The new Gator Helmet is a Bluetooth headset that can be paired with any. I am a Mac newbie and Bluetooth speakers do not work with Macs. Difference between vst kinematics using incremental and targeted sprints. In past studies, performance variables such as sprint time and sprint distance were examined using both an incremental and a targeted sprint protocol. To evaluate the difference between the protocols, the hypothesis that the variation of pacing strategy or the quality of pacing strategy should be statistically different between these protocols were investigated. Eight well-trained cyclists (mean +/- SD: age 21 +/- 2 years; height 182.8 +/- 6.5 cm; body mass 77.3 +/- 9.6 kg; VO2max 60.0 +/- 1.2 ml x kg x min(-1)) performed a 2 x 5 km time trial. The subjects underwent a targeted sprint trial (TPT) in the fastest 20 min of a 30-km time trial as a reference, an incremental 10-km time trial (IPT) followed by a 20-km time trial (TPT2). The velocity of a 10-s phase of the TPT was converted to a velocity running time (VTR) by dividing the total 10-s phase time by the total distance of the 10-km cycle. The ratio of the VTR in the 20-min phase (20-min VTR) was converted to a specific VTR (SVTR), which was calculated by dividing it by the work performed in the 20-min phase. The SVTR from the IPT was used as the reference and was compared to the SVTR from the TPT. During the TP1 of the TPT, the SVTR from the IPT (0.78 +/- 0.07) was lower than the SVTR from the TPT (0.90 +/- 0.07, p
