FilesInBack-AES-256- Encrypted Backup Software is a Windows-based backup/restore software program that provides a hassle-free way to select files and folders, arrange them according to the preferred order and backup them to a secure place on your drive. Select files and folders Once you have selected your files and folders, you can give some importance to them by dragging them to the protected area on your hard drive. Next, it is also possible to mark them as optional, depending on their security. You can also add backup keys and folder names. Encryption In order to encrypt selected files and folders, drag them to the Encryption area and choose the AES 256 algorithm (the best available option at the moment). This software program enables you to use your own password in order to access the encrypted files. Restoration Select files and folders from the backup saved on your PC and drag them to the Restore area. Select the desired destination and you will be able to see the restored files, right away. ProtectFile [Latest-2022]

ProtectFile is a very convenient piece of software, which makes it possible to protect any file in your hard drive or any connected removable drives, with just a few simple steps. The utility does require to enter a password (repeated twice), but it was designed to require minimal effort and doesn't significantly affect system performance, having all the tools powered by AES. Installation: No additional software is needed to install the software, as it is a stand-alone utility, which is fully compatible with Windows 10, Windows 8, Windows 7, Windows Vista and Windows XP. The software is completely free of third party advertisements and highly customizable, being able to get rid of any annoying notification alert. Interface: The utility is packed with a clean and intuitive interface, which is designed to make operating it a lot easier. The implementation of the program does not only consist of a main interface, but also of a Context menu with a number of items, including the "Encrypt" and "Decrypt" submenus. Features: To begin with, the application is really convenient. It makes it possible to protect one or more files (can be done as many as you want) which you are saving to your hard drive. You can choose the way of enabling protection and add a password that you are going to use to encrypt your files. Once the files are protected, it is possible to open them in a new window, but you will not be able to open them if they are protected. However, you can just right click on them and select the "Decrypt" option, which will make the files available again. Although it is still an early version, ProtectFile is a new and efficient piece of software, which provides a super easy to use interface that is a joy to operate. The software is totally free, having no hidden charges attached to it, in addition to being fully customizable, as you can easily remove the context menu integration. ProtectFile is a completely free software, so you can download it right now and get started in a fraction of a second. The trial version is not only compatible with Windows XP, Windows Vista, Windows 7, Windows 8, Windows 10 but also a lot of other OS as well. The latter is really convenient, due to the fact that you may test the features and compatibility of the program and decide whether it is indeed what you are looking for or not. The software is 100% free and does not include any additional costs. It

What's New in the ProtectFile?

ProtectFile is a handy utility which lets the user protect their files from their hard drive or connected removable drive with just a few clicks. The installation process does not offer to add other third-party products and runs smooth. After wrapping it up, you come face to face with a minimally-designed and intuitive UI, which enables anybody to easily find their way around it, be they experienced or not with computers. This software program uses an AES (256) algorithm in order to protect your files from prying eyes, and also adds an entry in the Windows Explorer context menu. The latter feature enables you to manage items in a more efficient manner. Passwords will have to be input twice, while it is also possible to keep a copy of the unprotected items (will be kept in the same location) and save passkeys for encrypting the next file. Removing the protection can be achieved by opening the appropriate part of the utility, selecting the PF file, providing the correct password and clicking the "Remove protection" button. You can also force ProtectFile to open the file after the decryption is complete. This app is perceived by Windows as a background process, which means it is not going to burden the computer's performance, and you can run it alongside other tools, without facing issues. Limited Help contents are provided, yet seeing how easy it is to use, it becomes apparent they are not actually necessary. All in all, ProtectFile proves to be an efficient piece of software, with a non-obtrusive and intuitive interface, Windows Explorer context menu integration and good response time. Nevertheless, power users might find it a bit too simple. ProtectFile is a handy tool which helps people protect items from their hard drive or any connected removable drive (e.g. USB flash drive), with just a few clicks.
