p.s. don't download malware using Facebook. When in doubt, don't. A: first of all you need to understand that a question here should always be self contained. Having said that all I have is a guess. I'm guessing that your application is in VB.NET. This should be no issue at all and your windows installer should deploy your application as an EXE. From the details of the malware you posted, it does not seem like an executable is launched or even extracted. (Though this could be a false impression.) My guess is that the malware extracts its payload to a.sys file and runs it from there. For this reason, you shouldn't allow downloading of EXEs or executables from your application. This should make it easier for you to detect malicious activities on your web page. MSI is a loose standard for installers and this should easily be handled with proper coding. Your problem now is that you want to detect the malware, without firing up the MSI and launch an actual exe. This sounds like a good topic for SuperUser. You can also try to detect the useragent and try to detect the malware by that or implement some form of reverse engineering. If you want to be able to detect malware without the need of a MSI, you'll need to get a minimum understanding of how to decode a PE file to get to

the payload. This can be found here: Hope that helps. EDIT: Oh and also please see my comment below your question about detecting the malware as it can be easily done without MSI. EDIT: If you are not interested in expanding to get that extra payload, then just continue to detect malware and you'll be fine. This is easily accomplished without an installer. Just keep it up to date and your application will remain safe. If your get a report that malware is detected, then investigate deeper and fix the detected malware. going to teach our students an English skill." "It's not the kind of course

Quotes from the Experts

“The future of medicine will be using robotics and haptic feedback” Prof Alan Fenwick, Director and Vice-Chancellor of the City University of Hong Kong

“DNA is the most complex information system that we know of in the Universe” Prof Marcus Poon, University of Cambridge, UK and Hong Kong University of Science and Technology

The doctors of Tomorrow

“I cannot imagine a healthcare system without electronic medical records” Dr David S. Baum, Assistant Chief Medical Officer, Harvard Medical School

“In a post-genomic world, medical genetics will be all about the understanding of the human genome” Dr Paul Joseph, The University of Sheffield

“The future of medicine is out there and I expect that there will be new technologies and alternative therapies coming in”

Dr John Foss, Professor of Pathology at University of Texas at Austin and the Director of Alcor Science Foundation

The Future of the Body

“As high tech medical inventions become more widely available, our bodies will become ever more intelligent” Informatics Institute

“We are all terminal cases now, there is no

future " " Informatcs Institute Home of the latest mobile security threats "There will be no "future" for any old technology" " " Sophos "The best-guarded secret of the 21st century is security for everyone"; now " " Global Information Security Study Center "The time of security by some is now over" " " Wipro Technologies The Energy to Heal "It's the time for energy healing and alternative medicine" " " Joel S. Goldsmith, US Board-certified, CFNM, CNS certifying physician "In the 21st century, I believe that the time is now for health care to move beyond the conventional paradigm" " " Paul Bergner, MD, FASCP, FACC, FACP "Alternative health care is where the future is going" " " ?

A: We do have a question that we'd love to answer for you, but there's just so much "magic sauce" in the brainpower and reproduction problem. But here's what I can tell you, How many brainpower usages are there? Certainly, there are a vast number of real clinical usages... There are also a number of "brain-computer interface" applications (what you're asking about) -- optical arrays that brainwave patterns directly control lights, for example. When we have our champagne and are handing out the brainpower lotus prizes, there are many, many more -- whether or not we'll ever know what they are, it's for sure no concern of ours. In our searches of the literature, we've found the following usages -- but in our haste to cast off the theory, I just can't remember all of the things we've been told about the brain and reproduction. [Braine (and her predecessor, Forte) was telling us (and her predecessor) of the basic biology of the central nervous system -- which (thankfully) works the same regardless of whether we're human, zebra, or some unknown animal. They were telling us of

the nervous system's main function. The main function is to move muscle. The nervous system has two key functions: sensory and motor. Both of these are "peripheral" -- meaning they work at the periphery of the nervous system. "Sensory" peripheral nervous systems --- senses like smell, hearing, touch, sight, and taste. "Motor" peripheral nervous systems -- muscles. A muscle that has a central nervous system -- what we call a "brain" -- is a spinal cord, or brain -- but that is really peripheral to a central nervous system. In humans, and in many animals, certain structures at the end of the spinal cord form a chain. While they look like a simple, linear tube, the spinal cord has lots of branching, and can be a maze rather than a linear conveyor. The motor/sensory peripheral part of the nervous system forms a pulseless (and conserved) spinal fluid-filled cavity, where little nerves branch and form into the various muscles. The brain has a direct connection to the spinal column via a peripheral nervous system
