\_Image post-processing\_, also called image editing or image retouching, is the broad term for what you do to photos and paintings to enhance them. The two terms are often used interchangeably. This book uses the more specific term, \_image editing\_. \_Image cropping\_ is the process of removing or taking out part of an image without distorting the picture. This is one of the most common manipulations performed on a photo. Cropping helps you to make an image better, smaller, or give it more drama. \_Lighting\_ or \_key lighting\_ is the act of adding light or shadow to an image to make something look more dramatic or interesting. This also allows a photographer to hide parts of a subject when the subject was photographed with the sun in the middle of a bright window. An image could have a lot going on, and you can easily lose perspective in an image simply by trying to tell too much. You can quickly burn out your viewer's ability to keep track of what they're seeing. Good photographers create an image that tells a story while not getting too cluttered. You can use cropping, lens distortion, and light to help you tell a story. The light is always changing; the only way to capture that light is through a camera lens or an artistic medium like paint. This is why lighting is an integral part of any great image. Artistic lighting is how you create a mood in an image. If you keep that mood going from shot to shot, your images take on a life of their own. One of the things that makes editing an image fun is the ability to make the process interactive. You can add and remove layers and make the changes completely transparent. This gives you the ability to add a lot of layers, allowing you to do lots of fun and creative things. You can change the colors and exposure, manipulate the contrast, add or subtract whites, make an image look like it was painted on the photo, add effects, even change the subject.

Although Photoshop Elements features are limited, it's a compelling alternative to using the full-featured Photoshop. Adobe Photoshop Elements comes installed on your desktop, meaning that you don't need to download it. Some files are saved in the program, so you can save your work later, if you want. The program is compatible with Windows 7, Windows 8.1 and Windows 10. In older versions, you can download it from the Adobe website. Quick Photoshop Elements Basics This article will cover the essentials that you need to know about Photoshop Elements and will provide you with some basic tips and tricks. Let's get started. 1. Open the program. Once you start the program, you can immediately begin working on your files by opening a new document. You can save your images in the program or you can download them online. If you don't want to use any saved documents, click File > New, and then choose the size of your document. 2. Choose a file format. If you want to use a saved file, just open it. If you want to download a new image from the internet, you need to choose a file format. Most of the time, you won't have to choose this option. From the File menu, choose Open (or from the File menu, choose Save As). You have two options to save files in the program: Save and Save As. Save lets you choose a location and then automatically saves the file there. This is good if you want to save several files to your computer. You can change the location of your files later. Save As lets you save files in a specific folder and then renames the file for you. This is good if you want to save files locally so that you can easily find them later. You can save a new image, a copy of an existing image, a copy of the original image, a new document, or a copy of the document that you are working on. Choose the one that you want. 3. Choose a color profile. From the View menu, choose Edit Color, and then choose a color profile. Photoshop Elements includes dozens of color profiles. You may need one that is specific to your monitor or to your printer. 4. Choose the display options. You can change the number of zoom levels 05a79cecff

At the Battle of Verdun in 1916, the German General Staff employed a new strategy, known as the defense-in-depth plan. Instead of mounting a costly frontal attack on the French position in the woods, the Germans took an alternative approach by employing local raids led by armored cars and tanks. By the end of the war, millions of shells were being fired by both sides at the front line. As the front lines shifted frequently, the German and French soldiers were exposed to the ever-present dangers of artillery fire. Explosions within close proximity to the front lines were common occurrences, and it was not unusual for shell fragments and shrapnel wounds to be common injuries. These are some of the injuries seen at the hospital in 1916. I especially like this man with a shrapnel wound below his right eye. Other injuries include legs blown off, both arms and one leg torn off, and faces cut in half. This is the view of the church and the cemetery above the front lines in 1916. The weapon pictured above is the Swiss Chianti Field Gun. It was built in the early years of the century and is in excellent working condition. The gun fired a 450mm shell, and a 3,500-pound charge was inserted into the breech. The ammunition consisted of eight different loads with shell weights ranging from 200 to 500 kg. The shells were fired at a rate of 800 per minute. The barrel was measured at a length of 1,338cm. This soldier has a burst, splinter, and shell fragment wound on the left elbow. His pants have been cut open by a bullet. A large part of his left calf has been severed and he has several long shards of shrapnel protruding from the soles of his feet. His arm was left in pristine condition as was the skin. The wound is visible on the back of his left hand. Dahlgren guns were built by Dahlgren & Company, a shipbuilding and ordnance company founded in Boston in 1810. It was acquired by the Bethlehem Steel company in 1915. The Dahlgren guns were typically fitted on battleships, and their front two turrets were modified for use on the tanks. The massive turret would be mounted on the bottom of the tank. The massive gun weighed 28 tons, and it was capable of firing a 285-mm shell with a maximum range of 14,000 meters. This soldier has a traumatic lesion on his left

===== This study was supported by a grant from the Robert Bosch Foundation. Field of the Invention The present invention relates to a radio communication system that performs retransmission control in response to an error that occurs in data that is transmitted and received via a radio link. More specifically, the present invention relates to a radio communication system including an addition value generation apparatus that adds the error value of the data that is subject to the retransmission to the original data and transmits the added value to a receiver apparatus. Description of the Related Art A radio communication system using a radio link is known. In the radio communication system, a sender (transmitter) apparatus transmits data that includes error bits to a receiver apparatus via a radio link and the receiver apparatus receives the data via the radio link and then performs demodulation processing on the received data. If a data transmission error occurs, the receiver apparatus causes the sender apparatus to retransmit the data, the receiver apparatus having received data including error bits with the data that has been transmitted by the sender apparatus. Jpn. Pat. Appln. KOKAI Publication No. 2013-51245 discloses a retransmission control method for retransmitting the data that has been transmitted, by which a receiver apparatus can detect an error bit with high accuracy, even when the error bit is detected and demodulated in the demodulation processing. In the retransmission control method, data in which the data that has been transmitted and data in which the data that has been received are recorded in a buffer is generated and a bit error that occurs in data that has been transmitted is detected based on the data that is recorded in the buffer. Specifically, when error detection is performed, the bit error that occurs in the data that has been transmitted is detected according to a detection rule that is set for each bit.
