Overspeed Sensor.This invention relates generally to film extruders and, in particular, to an improved film extrusion coating die. Various methods and apparatus for extruding thermoplastic polymeric materials are known to the art. A known film extrusion coating die has a die body which is mounted within a die housing. The housing is attached to a source of compressed air which forces the air through a restricted opening or throat in the die body into the die cavity. Thermoplastic material, usually in the form of a molten extruded tube, is forced through a die opening or slot within the die body as the material is subjected to the pressure of the compressed air. The compressed air is discharged through the throat of the die body. The compressed air tends to flow within the die body, or along its sides, through the throat to the outside of the die body and then to the outside of the die housing. If the compressed air does not exit through the throat properly, the air can cause other components in the die, such as a pump and/or a heater, to malfunction. For example, if the compressed air exiting from the throat is not channeled properly, it can disrupt the flow of molten plastic in the die and/or damage the heating elements.

Additionally, a buildup of air pressure within the die
