Q: How to know if a superuser in MySQL I need a function in my app that checks if user is superuser or not, what is his privileges (execute, read, create, update, delete) in mysql. I find a lot of tutorials, but they are old and my sql knowledge is not good. Also I haven't found a good explanation about `mysql_real_escape_string()` in the internet. Best regards, A: The statement; "There is a strong preference for having users NOT log in as a super user." You should assume that users have NO special rights to access your database. In that case you can setup your database to trust all passwords. You can use `show grants;` to determine what privileges a user has for a given database. The resulting output will look something like this; `GRANT USAGE ON *.* TO 'someone'@'localhost' IDENTIFIED BY PASSWORD 'abcd1234'` If you are on Windows then the password is being stored in a Windows registry hive. Depending on the version of Windows, you may need to look up the password here.
